Project Elara

Vision: Project Elara is a next-generation Al-powered e-commerce platform designed to merge shopping convenience, personalization, and intelligent product discovery. By leveraging Django for the backend and React for the frontend, it provides scalability, security, and seamless user experience.

Technical Architecture

- Backend: Django + Django REST Framework (API-driven, modular apps for products, users, orders, and AI assistant).
- Frontend: React for modern, responsive UI with a personalized shopping experience.
- Database: PostgreSQL (primary store for products, users, and orders).
- Al Assistant: Connected via Django service layer integrating with Al models (OpenAl, HuggingFace, or custom).
- Deployment: Docker containers orchestrated with Kubernetes or Railway.
- Static Content: Managed by Django staticfiles or served via CDN for performance.

Proposed Folder Structure

project-elara/ $\blacksquare \blacksquare \blacksquare$ database/ \rightarrow Database scripts and migrations $\blacksquare \blacksquare \blacksquare$ djangoapp/ \rightarrow Django apps (products, users, orders, assistant) $\blacksquare \blacksquare \blacksquare$ djangoproj/ \rightarrow Core Django project (settings, urls, wsgi, asgi) $\blacksquare \blacksquare \blacksquare$ frontend/ \rightarrow React frontend (user interface) $\blacksquare \blacksquare \blacksquare$ static/ \rightarrow Static assets (CSS, images, JS) $\blacksquare \blacksquare \blacksquare$ Dockerfile \rightarrow Build instructions $\blacksquare \blacksquare \blacksquare$ deployment.yaml \rightarrow Kubernetes/Railway deployment config $\blacksquare \blacksquare \blacksquare$ entrypoint.sh \rightarrow Startup script $\blacksquare \blacksquare \blacksquare \blacksquare$ manage.py \rightarrow Django management CLI $\blacksquare \blacksquare \blacksquare \blacksquare$ package.json \rightarrow Frontend dependencies $\blacksquare \blacksquare \blacksquare \blacksquare \blacksquare$ requirements.txt \rightarrow Backend dependencies

Django App Modules

- Products: Models, APIs, and business logic for managing catalog and categories.
- Users: Authentication, profiles, and roles.
- Orders: Cart, checkout, and payment integration.
- Assistant: Al-driven shopping helper with personalized recommendations.

Development Roadmap

- Phase 1: Setup Django project, database, and Docker environment.
- Phase 2: Implement Products and Users apps with API endpoints.
- Phase 3: Add Orders and payment gateway integration.
- Phase 4: Develop AI Assistant with conversational interface.
- Phase 5: Integrate React frontend with Django APIs.
- Phase 6: Deployment and scaling (Kubernetes, Railway, or AWS).
